(54) Title: TEMPERATURE REGULATING CATHETER AND METHODS

(57) Abstract.

The invention provides methods and apparatus for regulating the temperature of a liquid medium while the liquid medium is within a patient. According to one exemplary method, a catheter (20) is provided having a catheter body (22) with a proximal end (24) and a distal end (26). At least one lumen (28) extends between the proximal end (24) and a distal end (26) and an internal temperature altering region (14) is near the distal end. The catheter (20) is introduced into a body structure until the temperature altering region (14) is near a target area within the body structure. A liquid medium is introduced into the lumen so that the temperature of the liquid medium may be altered while passing through the temperature altering region (14).

5 TEMPERATURE REGULATING CATHETER AND METHODS

BACKGROUND OF THE INVENTION

The present invention relates generally to the regulation of the temperature of a fluid that is to be delivered to a specific target location within a body structure. More particularly, the invention provides methods and apparatus for altering the temperature of a fluid that is to be delivered to the target location while the fluid is within the patient.

10 On many occasions, the temperature of a fluid within a patient needs to be regulated. For example, in some medical procedures, various fluids, such as solutes or drugs, are delivered to target locations within the body. The desired temperature of these fluids upon delivery may vastly differ from the storage temperature. In such cases, it is therefore desirable to heat or cool the fluid before it reaches the target location. Although possible to heat or cool the fluid outside of the patient, such a procedure can be cumbersome and require elaborate equipment.

15 As another example, fluids at various temperatures may be introduced to a target location within a patient to regulate the temperature of a localized area within a body structure. One particular application where the heating or cooling of a specific area within a body structure is desirable is in the field of neurosurgery. In many cases, it is desirable to cool a specific area within the brain prior to performing a surgical procedure.

20 As a further example, the temperature of body fluids may be regulated to control the patient's body temperature. The regulation of the patient's body temperature is particularly useful in treating patient's suffering from either hypothermia or hyperthermia.

Under ordinary circumstances, the thermal regulatory system of the human body maintains a near constant temperature of about 37°C (98.6°F). Heat lost to the environment is precisely balanced by heat produced within the body.

5 Hypothermia is a condition of abnormally low body temperature. Hypothermia can be clinically defined as a core body temperature of 35°C or less. Accidental hypothermia results when heat loss to the environment exceeds the body's ability to produce heat internally. Hypothermia may also occur in
10 patients exposed to mild cold stress whose thermal regulatory ability has been lessened due to injury and illness.

Hypothermia of either type is a dangerous condition which can have serious medical consequences. In particular, hypothermia interferes with the ability of the heart to pump
15 blood. Hypothermia may be fatal for this reason alone. Additionally, low body temperatures seriously interfere with the enzymatic reactions necessary for blood clotting. This sometimes results in bleeding that is difficult to control, even when normal clotting factor levels are present. These
20 effects and other adverse consequences of hypothermia lead to drastically increased mortality rates both among victims of trauma and in patients undergoing surgery.

Hyperthermia is a condition of abnormally high body temperature and may result from exposure to a hot environment, overexertion, or fever. Body core temperatures can range from
25 38°C to 41°C due to fever and may be substantially higher in cases of exposure and overexertion. Like hypothermia, hyperthermia is a serious condition and can be fatal.

Simple methods for treating both hypothermia and
30 hyperthermia have been known since early times. In the case of hypothermia, such methods include wrapping the patient in blankets, administering warm fluids by mouth, and immersing the patient in a warm water bath. To treat hyperthermia, some have proposed immersion of the patient in a cool water bath or
35 the administration of cool fluids. However, such methods can have serious drawbacks and limited effectiveness.

One particular catheter structure which has been developed to treat a patient suffering from either hypothermia

or hyperthermia is described in U.S. Patent No. 5,486,208, the complete disclosure of which is herein incorporated by reference. Such a catheter has the ability to heat or cool a liquid that is circulated through a catheter body.

5 Although such a catheter has been shown to be generally effective in the treatment of both hypothermia and hyperthermia, some improvements are still desired. For example, it would be desirable if such a catheter were more versatile to allow for the temperature of various fluids
10 introduced into the body to be regulated. In this manner, the temperature of an introduced fluid could be more closely controlled at the point of introduction. It would be further desirable if a catheter structure and methods were provided for regulating the temperature of a localized region within a
15 body structure prior to performing a medical procedure on the body structure.

SUMMARY OF THE INVENTION

The invention provides methods and apparatus for
20 regulating the temperature of a fluid while the fluid is within the patient. Such a fluid can include, for example, an externally introduced fluid, an internal body fluid, or both. To provide such features, the present invention in one exemplary embodiment provides a catheter comprising a catheter
25 body having a proximal end and a distal end. At least one lumen defining a luminal wall extends between the proximal end and the distal end. A temperature altering mechanism is disposed within the catheter body which heats or cools the luminal wall to alter the temperature of a fluid passing
30 through the lumen.

The temperature altering mechanism may comprise a heater or a cooler, and is preferably located at a temperature altering area. The temperature altering area may be located anywhere along the catheter body and in some embodiments will
35 preferably be located near the distal end of the catheter. In another aspect, the temperature altering mechanism is preferably disposed near the luminal wall to heat or cool the luminal wall without substantial heating of an outer surface

of the catheter body. In this manner, a fluid may be externally introduced into a patient through a proximal port and be heated or cooled at the temperature altering region without heating or cooling of the outer surface of the catheter body. In this way, when the fluid exits the distal end of the catheter body, the fluid will be within a desired temperature range so that only a particular location within the patient which is near the distal end of the catheter will be heated or cooled.

In one exemplary aspect, a plurality of orifices are disposed within the catheter body to permit a body fluid to flow through the orifices and into the lumen. As the body fluid passes through the temperature altering region, the temperature of the body fluid is altered. In this manner, the catheter is provided with the versatility of altering the temperature of an externally introduced fluid, an internal body fluid, or both. In a particular aspect, a one-way valve is associated with each orifice to prevent the body fluids from entering into the lumen when an external fluid is injected into the lumen from the proximal port. The valves are configured to open when the pressure of the body fluids outside of the catheter body are greater than the pressure within the lumen. In this manner, body fluids will freely flow into the lumen for heating or cooling until a fluid is injected into the lumen from outside of the patient to close the valves. In one particular aspect, the valves comprise flaps that are attached to the luminal wall and will remain open due to the pressure exerted by the body fluid until an external fluid is injected into the lumen.

The temperature altering mechanism may be configured in a variety of ways. For example, the temperature altering mechanism may comprise a resistive heater employing either electrical or radio frequency current. Various chemicals may also be employed to heat or cool the luminal wall.

Alternatively, laser energy may be employed to regulate the temperature of the catheter body. In one particularly preferable aspect, the temperature altering mechanism comprises a first path which is adjacent the luminal surface

) and a second path which is adjacent an outer surface of the catheter body. In this way, a heat transfer fluid may be introduced into a heat transfer fluid port where it will flow through the first fluid path adjacent the luminal wall. As
5 the heat transfer fluid flows through the first path, heat is transferred to or from the fluid flowing within the lumen. The heat transfer fluid is then circulated through the second path where it will exit the catheter body outside of the patient.

10 The invention further provides an exemplary method for altering the temperature of a liquid medium while the liquid medium is within a patient. According to the method, a catheter is provided having a catheter body with a proximal end and a distal end. At least one lumen extends between the
15 proximal end and the distal end, and an internal temperature altering region is provided. The temperature altering region may be located anywhere between the proximal end and the distal end, and in some cases will preferably be located near the distal end. With this configuration, the catheter is
20 introduced into a body structure until the temperature altering region is near a target area within the body structure. A liquid medium is introduced into the lumen, and the temperature of the liquid medium is altered while passing through the temperature altering region. In this way, the
25 temperature of the liquid medium is altered when delivered to the target area.

In one exemplary aspect, the catheter is configured such that the liquid medium may be introduced to the lumen at the proximal end or introduced into the lumen through orifices
30 disposed within the catheter body near the temperature altering region. In this way, a liquid medium may be introduced into the lumen from outside the patient while body fluids may also be introduced into the lumen by perfusing through the orifices. This allows various fluids, such as
35 solutes, drugs, blood substitutes and the like to be externally injected into the catheter and then be heated or cooled before reaching the target location. Further, various

body fluids, such as blood, may be heated or cooled while within the patient.

In one exemplary aspect, the method provides for preventing the body fluids from entering into the lumen while a liquid medium is externally introduced into the lumen. Following the introduction of the external liquid medium, the method provides for allowing body fluids to again enter into the orifices where they pass through the temperature altering region.

Configuration of the catheter in this manner allows for the performance of various medical procedures. For example, the distal end of the catheter may be positioned near a target site where a drug or solute is to be introduced. Inclusion of the temperature altering region allows for the drug or solute to be heated or cooled to a desired temperature upon delivery. Other fluids may also be introduced to the temperature altering region to regulate the temperature of a particular location within a body structure prior to performing a surgical procedure. For example, such a method may be employed to cool a particular vessel within the brain. Inclusion of the orifices also allows for convenient temperature regulation of the patient's blood so that a patient suffering from either hypothermia or hyperthermia may be treated.

In one exemplary aspect, the temperature of the liquid medium is altered without substantial alteration of the temperature of an outside surface of the catheter body. In another aspect, the temperature of the liquid medium is preferably heated by a temperature in the range from about 38°C to about 40°C. In a further aspect, the temperature of a liquid medium will preferably be cooled by a temperature that is in the range from about 36°C to about 30°C.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 depicts a distal end of a catheter according to the present invention which is inserted into a vessel of a patient.

Fig. 2 is a cross-sectional side view of the catheter of Fig. 1 taken along lines 2-2 and depicting a temperature altering region.

Fig. 3 is a side view of an exemplary catheter for heating or cooling a fluid passing through an internal lumen according to the invention.

Fig. 4 is a more detailed view of a distal end the catheter of Fig. 3.

Fig. 5 is a side view of an alternative catheter for heating a fluid passing through an internal lumen according to the invention.

Fig. 6 is a side view of the catheter of Fig. 5 taken along lines 6-6.

Fig. 7 is a side view of another alternative embodiment of a catheter for heating or cooling a fluid passing through an internal lumen and having a plurality of perfusion orifices for allowing body fluids to enter into the internal lumen according to the invention.

Fig. 8 is a cutaway side view of a portion of the catheter of Fig. 7 showing a plurality of flaps which are closed to prevent body fluids from entering into the internal lumen when a liquid is externally injected into the lumen.

Fig. 9 illustrates the catheter of Fig. 8 showing the flaps opening to allow body fluids to enter into the internal lumen when no fluids are externally injected into the lumen.

DESCRIPTION OF THE SPECIFIC EMBODIMENTS -

The invention provides methods and apparatus for regulating the temperature of a fluid that is to be delivered to a target location within a body structure while the fluid is within the patient. The regulation of the fluid's temperature in this manner lends itself to a variety of applications including heating or cooling the temperature of a drug or solute before its delivery to a target site. Regulation of the temperature of the injected fluid may also find use in regulating the temperature of the target location itself in preparation for various medical procedures,

including neurosurgical procedures within the brain. Further, the methods and apparatus allow for a patient's body temperature to be controlled by warming or cooling the patient's blood in situ. By warming or cooling the patient's blood, the patient's body temperature may thereby be increased or decreased as desired. Such methods and apparatus therefore provide a convenient therapy for treating hypothermia or hyperthermia.

Fig. 1 depicts a distal end 10 of a catheter 12 according to the present invention. The catheter 12 has been inserted through the patient's skin into a blood vessel BV. Blood flow through the vessel is indicated by a set of arrows F. At distal end 10 is a temperature altering region 14, it being appreciated that the temperature altering region may be located anywhere between the proximal end and the distal end.

As best shown in Fig. 2, catheter 12 includes an internal lumen 16. A temperature altering mechanism 18 is provided adjacent the luminal wall of lumen 16 at the temperature altering region 14. For convenience of discussion, temperature altering mechanism 18 is illustrated schematically and may comprise a variety of mechanisms that are employed to either heat or cool the luminal wall of lumen 16 to heat or cool the fluid passing through lumen 16 at the temperature altering region 14. Exemplary mechanisms for heating or cooling the luminal wall include heated or cooled fluids passing through catheter 12 near the luminal wall, resistive elements disposed within catheter 12, laser energy that is supplied to the temperature altering region, various chemicals disposed within the catheter body, thermoelectric crystal, and the like. Use of such mechanisms allow fluids passing through lumen 16 at the temperature altering region 14 to have their temperature altered so that they will be within a desired range when exiting catheter 12.

Catheter 12 may be manufactured in various sizes depending upon the particular application. For most uses, it will have a length in the range from about 30 cm to about 130 cm and a diameter in the range from 6 to 12 French (1 French = 0.33 mm). Catheter 12 will preferably be flexible to allow

the catheter to be moved through various vessels within a patient, preferably with the assistance of a guidewire.

Techniques for inserting catheters into various blood vessels are well known among medical personnel.

5 Although the method of the present invention will probably be most commonly employed in a hospital, the procedure need not be performed in an operating room. The apparatus and procedures are so simple that the catheter may be inserted and treatment may begin in some cases even in an ambulance or in
10 the field.

Temperature altering mechanism 18 will preferably be configured to heat a fluid passing through the temperature altering region so that its temperature will be heated by at least 5°C to about 42°C. When cooling a fluid, the
15 temperature altering mechanism 18 will preferably be configured to cool the fluid by at least 7°C to about 30°C. Temperature altering mechanism 18 should be designed to optimize the rate of heat transfer between the catheter and a fluid flowing through the internal lumen. Further, the
20 temperature of the catheter should be carefully controlled to prevent undesirable chemical changes within the blood. This is especially important when applying heat to the blood as blood is readily denatured by even moderately high temperatures. The temperature of the luminal wall for warming
25 blood should generally not exceed about 42°C to 43°C. The amount of energy to be supplied to heat a patient's core body temperature is described in U.S. Patent No. 5,486,208, previously incorporated by reference.

The temperature altering mechanism 18 will
30 preferably be arranged within catheter 12 so that the temperature of the luminal wall may be heated or cooled without substantial direct heating of an outer surface of the catheter 12. In this way, catheter 12 may be employed to selectively heat or cool a specific target site by simply
35 positioning the distal end of the catheter at the target site and introducing a fluid through lumen 16.

Referring now to Fig. 3, an exemplary embodiment of a catheter 20 which circulates a heat transfer fluid to alter

the temperature of a fluid passing through the catheter will be described. Catheter 20 comprises a catheter body 22 having a proximal end 24 and a distal end 26. A lumen 28 extends between proximal end 24 and distal end 26. At proximal end 24 is a proximal port 30 through which various fluids may be introduced into lumen 28 from outside of a patient. Passing through catheter body 22 is a first fluid path 32 and a second fluid path 34. A first port 36 is in communication with first fluid path 32 and a second port 38 is in communication with second fluid path 34. In this manner, a heated or cooled heat transfer fluid may be introduced into first port 36 where it passes through first fluid path 32 adjacent lumen 28. As the heat transfer fluid passes through first fluid path 32, heat is transferred either to or from a fluid passing through lumen 28 to heat or cool the fluid to a desired temperature before exiting catheter body 22. After passing through first fluid path 32, the heat transfer fluid circulates back through catheter body 22 through second fluid path 34 where it exits second port 38.

Fig. 5 depicts an embodiment of a catheter 40 which employs resistive heating to heat a fluid passing through the catheter. Catheter 40 comprises a catheter body 42 having a proximal end 44 and a distal end 46. A lumen 48 passes through catheter body 42 between proximal end 44 and distal end 46. A proximal port 50 is provided to facilitate the introduction of fluids into lumen 48 from outside a patient. Disposed within catheter body 42 near lumen 48 are a plurality of wires 52 (See also Fig. 6). Wires 52 exit catheter body 42 through a port 54. Wires 52 may be connected to either a DC or low frequency AC power supply. As electrical current passes through wires 52, some of the energy is dissipated as heat to heat the luminal wall. Alternatively, a radio frequency or RF power supply may be employed to supply power to electrodes disposed within catheter body 42 to heat the luminal wall.

Referring now to Figs. 7 and 9, an exemplary embodiment of a catheter 56 which may be employed to heat or cool an externally injected fluid, to heat or cool a body

fluid in situ, or both. Catheter 56 comprises a catheter body 58 having a proximal end 60 and a distal end 62. Extending between proximal end 60 and distal end 62 is a lumen 64. A proximal port 66 is provided at proximal end 60 and allows various fluids to be injected into lumen 64 while port 66 is positioned outside a patient. At distal end 62 is a temperature altering region 68 which includes a temperature altering mechanism (not shown). The particular temperature altering mechanism may comprise any of those previously described with the other embodiments set forth herein. In this manner, a fluid which is injected into port 66 will pass through lumen 64 and have its temperature altered when passing through temperature altering region 68 in a manner similar to that previously described with other embodiments.

Catheter body 58 includes a plurality of perfusion orifices 70 which extend through the wall of the catheter body to provide fluid paths to lumen 64. As shown by the arrows in Fig. 7, a body fluid, such as blood, may pass through orifices 70 and into lumen 64 where it will have its temperature altered at region 68 so that the temperature of the body fluid will be within a desired range when exiting catheter body 58 at distal end 62 as shown.

As best shown in Figs. 8 and 9, attached to the luminal wall of catheter body 58 are a plurality of flaps 72. Flaps 72 are employed to control the passage of body fluids through orifices 70 and into lumen 64. Flaps 72 may be constructed to be similar to those described in U.S. Patent No. 5,180,364, the disclosure of which is herein incorporated by reference. As shown in Fig. 8, when a fluid is injected into lumen 64 at port 66, the pressure and direction of flow of the injected fluid will cause flaps 72 to close over orifices 70 so that essentially only the injected fluid will pass through temperature altering region 68. In this way, the temperature of the injected fluid will have its temperature altered so that it will be within a desired range when exiting the distal end.

As shown in Fig. 9, when no fluids are injected into port 66, the pressure of the body fluid within a vessel will

cause flaps 72 to open to allow the body fluids to flow through orifices 70 and into lumen 64. In this manner, a body fluid, such as blood, may have its temperature altered by passing through orifices 70 and through temperature altering region 68. The configuration of flaps 72 in this manner is advantageous in applications where the patient's core body temperature needs to be altered. By simply introducing catheter 56 into the patient, the blood which flows into lumen 64 via orifices 70 will have its temperature altered by the time it exits distal end 62. In the event that a solute or drug is also needed for therapy, it may be introduced into lumen 64 through port 66 and have its temperature be substantially the same as the exiting blood temperature.

Hence, the present invention provides methods and apparatus which are useful in regulating the temperature of various fluids while such fluids are within a patient. With such an arrangement, a variety of procedures may be performed. For example, a drug or solute that is introduced from outside the patient may have its temperature altered within the catheter before reaching a target location. Further, a fluid may be heated or cooled within the catheter to in turn heat or cool a specific region of a body structure prior to the performance of a medical procedure. In another alternative, the temperature of a patient's body fluid, such as blood, may be altered in situ to treat a patient suffering from either hypothermia or hyperthermia. Although several illustrated examples of means for practicing the invention are described above, these examples are by no means exhaustive of all possible means for practicing the invention. The scope of the invention should therefore be determined with reference to the appended claims, along with a full range of equivalents to which those claims are entitled.

WHAT IS CLAIMED IS:

1 1. A catheter comprising:
2 a catheter body having a proximal end, a distal
3 end, and at least one lumen defining a luminal wall extending
4 between the proximal end and the distal end; and
5 a temperature altering mechanism disposed
6 within the catheter body which heats or cools the luminal wall
7 to alter the temperature of a fluid passing through the lumen.

1 2. A catheter as in claim 1, wherein the
2 temperature altering mechanism comprises a heater.

1 3. A catheter as in claim 1, wherein the
2 temperature altering mechanism comprises a cooler.

1 4. A catheter as in claim 1, wherein the
2 temperature altering mechanism is disposed at a temperature
3 altering area of the catheter body.

1 5. A catheter as in claim 4, wherein the
2 temperature altering area is between the proximal end and the
3 distal end.

1 6. A catheter as in claim 1, wherein the
2 temperature altering mechanism comprises a channel within the
3 catheter body running parallel to the lumen through which a
4 heat transfer fluid may be passed.

1 7. A catheter as in 6, wherein the channel
2 includes a first path which is adjacent the luminal surface
3 and a second path which is adjacent an outer surface of the
4 catheter body.

1 8. A catheter as in claim 7, further comprising a
2 heat transfer fluid port in communication with the first path
3 and an exit port in communication with the second path.

1 9. A catheter as in claim 1, wherein the
2 temperature altering mechanism is disposed near the luminal
3 wall to heat or cool the luminal wall without substantial
4 heating of an outer surface of the catheter body.

1 10. A catheter as in claim 1, further comprising a
2 proximal port at the proximal end of the catheter body which
3 is in fluid communication with the lumen, whereby fluids
4 introduced into the proximal port may pass through the lumen
5 and have their temperature altered before exiting from the
6 distal end.

1 11. A catheter as in claim 10, further comprising a
2 plurality of orifices disposed within the catheter body to
3 permit a body fluid to flow through the orifices into the
4 lumen where the temperature of the body fluid may be altered
5 before exiting the distal end.

1 12. A catheter as in claim 11, further comprising a
2 one-way valve associated with each orifice wherein the valves
3 prevent body fluids from entering the lumen through the
4 orifices when closed and wherein the valves are configured to
5 close when introducing an injection fluid into the lumen from
6 the proximal port.

1 13. A catheter as in claim 12, wherein the valves
2 are configured to open when the pressure of the body fluids
3 outside the catheter body is greater than the pressure within
4 the lumen.

1 14. A catheter as in claim 13, wherein the valves
2 comprise flaps attached to the luminal wall.

1 15. A catheter as in claim 1, wherein the catheter
2 body is flexible and has a length in the range from about 30
3 cm to about 130 cm and an outer diameter in the range from
4 about 2 mm to about 6 mm.

1 16. A method for regulating the temperature of a
2 liquid medium while the liquid medium is within a patient, the
3 method comprising:

4 providing a catheter comprising a catheter body
5 having a proximal end, a distal end, at least one lumen
6 extending between the proximal end and the distal end, and an
7 internal temperature altering region near the distal end;

8 introducing the catheter into a body structure until
9 the temperature altering region is near a target area within
10 the body structure;

11 introducing a liquid medium into the lumen; and
12 altering the temperature of the liquid medium while
13 passing through the temperature altering region so that the
14 temperature of the liquid medium is altered when delivered to
15 the target area.

1 17. A method as in claim 16, wherein the
2 temperature of the liquid medium is altered without
3 substantial alteration of the temperature of an outside
4 surface of the catheter body.

1 18. A method as in claim 16, wherein the
2 temperature of the liquid medium is heated by a temperature in
3 the range from about 36°C to about 42°C.

1 19. A method as in claim 16, wherein the
2 temperature of the liquid medium is cooled by a temperature in
3 the range from about 36°C to about 30°C.

1 20. A method as in claim 16, wherein the liquid
2 medium comprises a body fluid which is selected from the group
3 of liquid mediums comprising solutes, drugs, body fluids, and
4 blood or blood substitutes.

1 21. A method as in claim 16, wherein the liquid
2 medium is introduced into the lumen at the proximal end.

1 22. A method as in claim 16, wherein the liquid
2 medium is introduced into the lumen through orifices disposed
3 within the catheter body near the temperature altering region
4 while the orifices are within the body structure.

1 23. A method as in claim 22, further comprising
2 introducing an injection fluid into the lumen from the
3 proximal end, and introducing the body fluid into the lumen
4 through the orifices while the orifices are within the body
5 structure.

1 24. A method as in claim 23, further comprising
2 preventing the body fluid from entering into the lumen through
3 the orifices when the injection fluid is introduced into the
4 lumen from the proximal end.

1 25. A method as in claim 24, further comprising
2 preventing the injection fluid from exiting the catheter body
3 through the orifices, wherein the injection fluid passes
4 through the temperature altering region and exits the catheter
5 body from the distal end.

1 26. A method as in claim 16, wherein the body
2 structure comprises a vessel.

1 27. A method as in claim 26, wherein the vessel is
2 located within the brain or other organ.

1 28. A method as in claim 16, wherein the
2 temperature altering step further comprises passing a heat
3 transfer fluid through a channel disposed within the catheter
4 body.

INTERNATIONAL SEARCH REPORT

International application No.
PCT/US97/23641

A. CLASSIFICATION OF SUBJECT MATTER

IPC(6) :A61M 25/00

US CL :604/264

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 604/49, 113, 114, 264, 280; 607/96,104-107

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	US 4,038,519 A (FOUCRAS) 26 July 1977, figures.	1, 2, 4, 5, 9, 10
X,P	US 5,653,692 A (MASTERSON et al.) 05 August 1997, Fig. 4.	1, 2, 4, 5, 9-11, 16-21, 26, 27
X,P	US 5,624,392 A (SAAB) 29 April 1997, Fig. 1.	1-8, 10,15

☐ Further documents are listed in the continuation of Box C. ☐ See patent family annex.

* Special categories of cited documents:	*I* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
A document defining the general state of the art which is not considered to be of particular relevance	*X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
E earlier document published on or after the international filing date	*Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art
L document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)	*A* document member of the same patent family
O document referring to an oral disclosure, use, exhibition or other means	
P document published prior to the international filing date but later than the priority date claimed	

Date of the actual completion of the international search

12 MARCH 1998

Date of mailing of the international search report

10 APR 1998
